

# MPDOPF: Mapping of Decentralized Variables to Centralized Variables done, everything packed into a structure suitable for OpenDSS Validation.

- I had node numbers for 4 Areas like 1: 41, 1: 19, 1: 20, 1: 54 but not a way to know which nodes do they refer to in the real 'centralized' system.
- I (manually) created a mapping between the two.
- I then used the mapping scheme to collate all 'area information' after optimization into a 'system information' for validating against OpenDSS.
